Vape Pen & Portable Vaporizers

Possible **RED** Flags:

- ✓ A coil with what looks like wax, butter, or a small shard of an amber colored substance
- ✓ A coil or tank that has a tar-like substance within or around the tank area
- ✓ Finally, the odor of marijuana

The 3 Common Parts of Many Vape Pens

Wax / Shatter

#1 "The Mouthpiece"

The mouthpiece is located on the top of the device and used to smoke the contents of the product in the device. Most mouthpieces can be pulled off or twisted off of the device.

#2 "The Tank"

The tank of the device is generally located on the top or in the middle of the device. This can usually be found by taking off the mouthpiece. The contents will be located within this area. Something of note, the tank can possibly be located on the bottom of the vaporizer, depending on the device.

Various different tanks will work for liquids (which could be nicotine, simple flavoring, or an oil version of drugs), dry herbal marijuana or waxy marijuana concentrates.

Wax On Coil

#3 "The Battery"

The battery is generally located on the bottom 1/2 or 2/3 of the device. The battery can be pre-charged allowing the user to not need any cords or battery packs for use of the device.

The Basics of E-Devices or Electronic Cigarettes & Vaporizers

There simply are no absolutes when it comes to one of these devices. Once a person purchases it and takes possession of it they can load it with any product they choose. With that being said, there are devices that can be geared towards specific uses. Basically, you can't just look at a device (even one that you believe might be geared towards drug use) and know it is being used for illegal use. There are some red flags to look for. (See below.)

All types of Electronic vaporizers have become popular; and with that popularity we have seen an upswing in the illegal use of these devices.

E-devices can carry many different uses. Certain e-devices are used for liquid forms of nicotine, liquid flavoring or various forms of marijuana. It can be very difficult to identify what particular devices are truly being used for.

Common terms that you will hear about the devices (used for drug use) are the words "discrete" or "stealthy"

There can be several forms, colors, odors and textures inside of the bowl area of an e-device.

JUUL VAPE

Educational Bulletin

As vape pen popularity continues to grow, the 'pen' types are ever evolving. A newer vape pen (or a pen that delivers nicotine) known as the JUUL (pronounced "Jewel") has gained a lot of popularity. The nicotine pods that load into this pen are sweet smelling and come in flavors such as Mango, Cool Mint and Crème Brulee (see photo to the right). You can purchase just the pen, or the pod, or all the items together in a "starter pack".

The JUUL vape has continued to receive high levels of attention through media outlets and on social media. The Juul has become so popular; it now has its own lingo. Using a JUUL is simply referred to as "Juuling". A JUUL can also be known as a "nic-stick".

Why is the JUUL so popular?

The JUUL has a name that separates it from other vape pens as it is not known as a vape but it is known as a JUUL. The JUUL can be carried and sometimes even displayed "in plain sight" without anyone suspecting it is a vape pen. The JUUL is small and rectangular in design. It is discrete and wouldn't stand out in your hand or in a backpack among other items. While being charged, the JUUL looks like a USB (bottom left) so those who are not familiar, or those who are familiar with the pen, would not realize that a vape was being charged in front of them. This creates an easier environment for it to be charged at school or even at home in the presence of parents.

JUUL VAPE INFO

WWW.TALLCOPSAYSSTOP.COM

Quote from a Tall Cop Training Attendee:

"The info about them came from (Tall Cop) training. I shared the Juul specifically with staff this morning in an email and we got both (Juul vapes) of them today..."

-HS School Administrator

Recently during one of my classes in the Midwest, a school administrator texted his daughter (a college student and asked about the Juul vape) and her response was:

"Ya dad everyone out here is using the Juul"

More Quotes:

"Our [school] bathrooms are like vaping lounges"- School Teacher

"We are seeing these non stop. Kids posting snaps with them in class they are easy to hide."

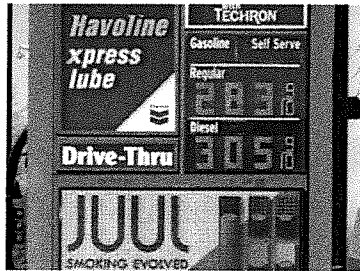

-School Resource Officer

DO YOUR OWN RESEARCH

Research JUUL popularity and products through social media and websites such as:

YouTube, EBay, Instagram, & Pinterest

Basic Street Level Info:

To understand the Juul, it is important to know some basic information about the device. I have found JUUL vape pens sold in convenience stores; smoke shops and other retail establishments. In some convenience stores, I have

seen the "traditional" tobacco on the back wall and the Juul vape pods sitting at the counter top...inches from my reach (see bottom right).

The Juul is a small sleek three-part system that consists of a charging port, the vape pen and a vape pod. The charging port has a USB attachment so it can be charged in a laptop, and the pen itself sits on the charging port and finally the nicotine pod (which is a separate piece) lodges into the top of the vape pen. When all three pieces of the device are put together it looks very similar to a USB drive (see photo from page #1)...especially when placed into a laptop for charging. You can purchase colored skins online with designs that can be wrapped on the JUUL to add a different look.

The JUUL Vape Pods:

The nicotine (sometimes flavored) for the Juul is distributed via a "pod". Each pod is said to be equal to a pack of cigarettes or about 200 puffs. As mentioned earlier, some of the pod flavors include Crème Brulee, Mango and Virginia Tobacco. The Juul is activated when someone takes a drag from the top of the device (pod). There is not an on / off switch for the Juul vape pen - making it quick and easy to take a drag from the device. The fruity taste and lack of lingering odor seem to also be popular among users.

Glossary of Terms for Marijuana Concentrates, THC Extractions

GENERAL: Post #1

Marijuana: a greenish-gray mixture of the dried leaves, flowers, stems, and/or seeds of the hemp plant, *Cannabis sativa*, *cannabis indica*, and *cannabis ruderalis*. Marijuana is used by smoking, eating, drinking, inhaling the vapors and applying to the skin. Also known as *weed*, *pot*, *herb*, *pot*, *grass*, *bud*, *ganga*, *Mary Jane*, *chronic*, *dope*, and *hydro* among many other slang terms.

Cannabinoids: The chemical compounds unique to cannabis. There are over 100 known cannabinoids, THC being the primary and most well-known.

Delta-9-tetrahydrocannabinol (THC): the mind-altering chemical contained in the cannabis sativa plant. This is the chemical that gets users high.

Cannabidiol (CBD): A cannabinoid associated with the medical marijuana community. It is less popular for recreational users because it is not intoxicating. CBD is currently being researched to learn more about its properties.

Potency: The percentage of THC in a given sample of marijuana. It is widely acknowledged that potency is difficult to calculate due many variations of the cannabis sativa plant as well as how it is grown and harvested varies greatly. Most experts agree that THC potency has risen over the last few decades, now approaching up to 30%. Marijuana concentrates contain even higher levels of THC that could range from 40% to 80%.

Flower/Bud: The actual flower of the marijuana plant that is harvested and used for the creation of marijuana products. *Flower* has also been referred to as the “old fashioned” way of smoking marijuana as opposed to use of concentrates.

Hydroponics: A system of growing plants, including marijuana, without the use of soil.

Kush: A popular strain, or brand, of cannabis plants.

420: A way to identify with the marijuana culture. The date, 4/20 is known as a date to celebrate getting high, and the time 4:20, is noted as an “official” time to get high. 420 is found around pop culture, in movies, online, and on shirts and hats.

Edibles: The term for marijuana that is ingested by mouth. Any edible food or drink that has been infused with cannabis extracts. Baked goods are the most common form of edible, but additional forms include flavored coffee drinks, breads, and candies, among others. Marijuana-infused butters or oils are also sold for individuals to make their own edibles.

Medibles: A term for edibles that are sold as “medical”, though the product is the same thing as edibles.

CONCENTRATES-SPECIFIC: Post #2

Marijuana concentrates: a highly potent THC concentrated mass that is extracted from the marijuana plant, most commonly similar in appearance to honey or butter. It is known on the street as *honey oil* or *budder*. Also knowns *THC Extractions* or *Marijuana Extracts*

Butane Hash Oil (BHO): a highly potent concentrate of cannabinoids made by dissolving marijuana in plant form in a solvent (usually butane). The resulting product is also referred to as *budder*, *honey oil*, *dabs*, or *shatter*, depending on how it is manufactured. BHO has a very high THC potency. The use of butane in extraction of BHO is cause for safety concerns as it is highly flammable and has resulted in violent explosions.

Wax: A common name for marijuana concentrates. It is a softer, opaque oil that has lost it's transparency through the extraction process. Depending on the method used to extract it, waxes may take on varying consistencies. Waxes tend to be harder, non-transparent oils. *Budder* and *honeycomb* are considered versions of wax.

Budder/Honey/Honey Oil: Slang terms used to describe marijuana extracts using butane. It is waxy in appearance, like honey or butter.

Shatter: A brittle form of BHO. It has the look of transparent amber glass and has a reputation for being the purest and cleanest type of extract.

Dabbing: The practice of smoking the THC-rich extracts of the marijuana plant, in the form of oils, waxes, or shatter, all of which contain extremely large amounts of THC. The extracts are usually prepared with butane (lighter fluid).

Tincture: A liquid preparation of marijuana (extract or plant-based) made with alcohol and usually dispensed using a dropper under the tongue.

Topical: A preparation of cannabis that has been added to a product, such as lotion or a cream and applied to the skin.

Vaporizer: A smoking device used to consume marijuana or tobacco products by heating the oils and creating a vapor for the user to inhale. There are three components to vaporizers: the cartridge which holds the concentrate, a heating device, and a power source (usually a battery). Vaporizers can be used to disguise marijuana use, as it is more difficult to detect. Users believe this method to be safer than smoking, though there has not been research to support that belief.

Oil Rig: A device or bong specially used for smoking marijuana concentrates. Adapters can be added to traditional bongs or pipes.

710: upside down, spells "OIL", a common term for dabs and marijuana concentrates. Like 420, 710 is a way to identify with the concentrates culture.
